

Wireless Technology

“ How intelligent is your video ? ”

Loronix's wireless solutions enhance the capabilities of a Networked Digital Video Management System (NDVMS) by creating an effective tool to increase efficiency and safety.

Security personnel are no longer tied to control rooms to monitor video. Now, with wireless technology, security staff can be moving about your facility while monitoring video and responding to real-time events making them more efficient and effective.

The Loronix software applications can run on handheld computers (PDAs) that use the Windows CE operating system. Through the PDA, authorized users will be able to perform multiple functions, including video monitoring, review, and PTZ (pan, tilt, zoom) camera control from virtually any location in the world.

Security and law enforcement officials will now have the advantage of knowing what an alarm situation entails before actually entering a building or area, and be able to deploy resources accordingly.

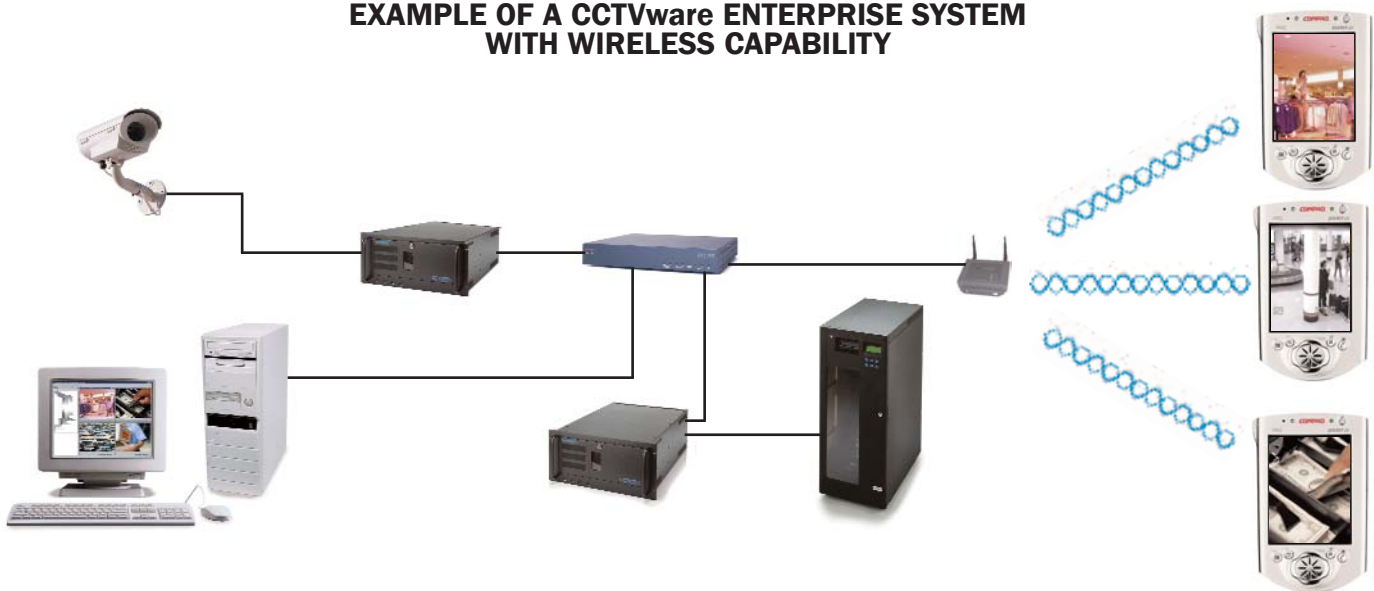

Users can also connect to multiple sites, review video alarms, and communicate with audio to other devices.

Wireless monitoring runs through a wireless network, or can be used via cellular technology, and is compatible with all Loronix systems.

Functionality:

- Runs on any Windows CE device such as Web Tablets, Pocket PC's, PDA's etc.
- Can be used in conjunction with any 802.11b compliant wireless devices such as Cisco Aironet products
- Live video viewing capability
- Ability to query and playback recorded video
- PTZ camera control
- Text overlay showing camera description and time stamp
- Alarm notification: device will automatically switch to camera view with active alarm
- Voice communication between CE devices
